Contact: Kevin S. Marshia, P.E.

LOCATION

Statewide – Vermont

DESCRIPTION

Vermont Agency of Transportation wished to provide motorists traveling Vermont highways with the best possible roadway conditions. The State had limited funds to meet their needs but their goal was to optimize the use of these funds toward maintaining the State's highways. .

CLD's challenge was to provide VTrans with a well-planned Pavement Management Program, avoiding the huge costs associated with the total reconstruction of the State's highways. CLD's staff served as an extension of VTrans' Pavement Management staff.

CLD has proven experience completing design and environmental work in connection with highway resurfacing projects and provided VTrans with a well-planned Pavement Management Program avoiding the huge cost associated with the total reconstruction of the State's highways. Our's staff served as an extension of VTrans' Pavement Management staff and utilizing our 12 year history and past experience on paving projects stepped up the manage the project. The type of highway resurfacing treatment was dependent on a number of factors. However, the primary type of treatments included reclaimed stabilized base, cold plane and overlay, or a simple overlay.

CLD has assisted VTrans with 120 miles of highway resurfacing projects throughout the State of Vermont so far and we have been able to help our client maintain their highways to the best possible conditions with very limited funds.
